

Allseas, founded in January 1985, opened offices in Châtel Saint-Denis, Switzerland, and The Hague, The Netherlands. The company invented the concept of pipelaying on DP (dynamic positioning) and builds Lorelay, the world's first DP pipelay vessel.

Allseas operates a versatile fleet of specialised heavy-lift, pipelay and subsea installation vessels. Our vessels are designed in-house and equipped with cutting-edge technology that allows us to push the boundaries of heavy lift, pipelay and subsea installation even further.

From offshore pipelaying to installing and removing offshore structures, Allseas excels in the design and execution of large and complex offshore projects for major oil and gas producing companies worldwide. Activities include design, engineering, procurement, fabrication and project management. Our vessels are equipped with cutting-edge technologies and focus on offshore pipelines for oil and gas as well as installation and removal of offshore platforms in a single lift.

Allseas has executed more than 290 projects and installed over 21,500 km of subsea pipeline worldwide. Project scopes range from straightforward pipeline installation jobs to contracts involving design, engineering, fabrication, installation and procurement, and large subcontracted scopes for diving, dredging, and rock dumping.
